NOTE to Ed Johnson

I have attached our April 15, 1983 memo on Glyphosate oncogenicity which describes TB's position that glyphosate is not oncogenic in the rat.

I have also attached memos from Dr. Kasza and Bert Litt which further describe our decision and rationale on glyphosate's oncogenicity potential.

The general procedure of combining certain histogenically similar tumors in the thyroid, as described in the referenced working paper from NTP, is considered standard operating procedure by TB and CAG.
